

LCC'S MOLECULES OF THE MONTH

Expanded Acrylamide Fragments Set

Recently, the use of **covalent fragments** as electrophilic probes has seen a revitalized interest within drug discovery. As a result, LCC were keen to make covalent fragments readily available to the drug discovery community via the creation of the **world's first commercially available enantiopair covalent sets**.

As LCC have **>700 modifiable fragments** in stock, we have made the decision to expand our current selection of **48 enantiopairs to 120 enantiopairs - starting with our acrylamides**. The modifications will be completed by our parallel synthesis team and other covalent tags are available upon request (i.e., Chloroacetamides, Diazirine Alkyne etc.)

It is an exciting time at LCC, and we hope that our colleagues in the drug discovery world can take full advantage of our sets! To find out more about our expanded sets please get in touch via the email below.
