

Molecule of the Month

2-methyl piperidines

A0003R

A0003S

For this month's MOTM we've chosen 2-methyl piperidines. 2-methyl piperidines are privileged scaffold in drug-like molecules which are very challenging to make in high purity and ee%. The methyl group in alpha to the nitrogen is a recurring motif in clinical candidates and approved drugs since it can modulate the physicochemical properties of the piperidine ring.

Our R&D team have developed an efficient and robust methodology for the synthesis of 2-methyl piperidines that allows access to differently substituted products which we can provide as the free base, HCl salt or N-Boc protected form according to your needs. They can be used as building blocks and/or fragments for screening.

Should you require analogues of these molecules to support your research activities don't hesitate to get in touch with us. Alternatively, if you would like to explore our complete range of products and services or require any further information regarding LCC, please use the enquiry button at the top of our webpage to get in touch.
